INGVIARELLA
Armin Mangold, John A. Elix & H. Thorsten Lumbsch

[From Flora of Australia volume 57 (2009)]

Type: *I. bispora* (Bagl.) Guderley & Lumbsch

*Ingvariella bispora* was excluded from *Diploschistes s. str.* due to the absence of a true exciple, this being replaced by a pseudoexciple of degenerating, pigmented hymenial elements. This monotypic genus has a world-wide distribution, but it is most common at higher elevations in semi-arid regions with winter rain.
